

We will develop on separate branches and merge our work to master.

We will be on time for our Scrum meetings.

We will communicate over slack as soon as there is a roadblock as opposed to waiting until we meet.

From 10/22 onward:

We will follow all standard React conventions and design patterns.

Camel case will be used for all javascript variables excluding constants.

Keep console.log() statements in master to a minimum.

All code checked-in to master should be free of ESLint warnings unless there is a reason for it not to be.

Code style is managed using the prettier-atom plugin for Atom, which can be run to automatically fix code style issues. The default configurations are used, but the basic conventions enforced by this package are:

- Indentation using 2 spaces
- A single space after open braces, and a single space after commas separating items in a list
- No space after opening parentheses, but do use a single space in-between comma-separated function parameters
- No space inbetween function name and opening parentheses
- Subsequent control flow structures (else if, else) after an "if" exist on the same line as the "if" statement's closing brace
- In a function definition, use a single space in-between the closing parentheses of parameter list and opening brace of function body

Notify team of framework changes.

Be nice.
