- Attempting to login with a chrome account which is already logged into the browser sometimes prevents the login from succeeding
  - We have no idea why this does not work, and it only appears to be an issue on Mitchell's Macbook
- HTTPS does not work
  - This is because the API calls are are HTTP, and the google login service detects that a site loaded with HTTPS is sending an HTTP call. Switching the URLs to HTTPS seems to break the google authentication, however.
  - Steps to fix it include switching the URLs to HTTPS and trying to better understand why HTTPS wasn't working with google authentication. It is probably something simple, we're just not experienced with web protocols.
